1985 MIDYEAR SUPPLEMENT

FRUIT PRODUCTION LOWER, VALUE HIGHER

The Nation's utilized production of the leading noncitrus fruit crops totaled 13.7 million tons (12.4 million metric tons) in 1985, down 1 percent from 1984 and fractionally lower than 1983. For the major noncitrus crops, tart cherries, cranberries, dates, grapes, kiwifruit, nectarines, olives, and pears registered increases, but these were more than offset by production decreases for apples, sweet cherries, peaches, pineapples, and plums and prunes. There were also declines for apricots, avocados, bananas, figs, papayas, and pomegranates. The value of utilized production from all noncitrus fruit crops in 1985 totaled 3.39 billion dollars, up 2 percent from 1984 and 6 percent higher than 1983. Increases in dollar values for avocados, cherries, cranberries, dates, nectarines, olives, pears, and California plums more than offset the declines in apples, apricots, grapes, peaches, and California dried prunes. Changes for other crops were mixed.

TREE NUT PRODUCTION AND VALUE LOWER

The 1985 season's U.S. tree nut production, at 774 million tons (702 million metric tons), was 10 percent below 1984, but 35 percent above 1983. Production was higher for filberts, macadamia nuts, pecans, and walnuts, but substantially lower for almonds and pistachios. The value of utilized production for all tree nuts totaled 720 million dollars, down 15 percent from 1984, but up 24 percent from 1983. Values decreased in 1985 for almonds and pistachios, but rose for all other tree nut crops.

1/ BUDDED, GRAFTED, OR TOPWORKED VARIETIES.

DEFINITIONS OF TERMS

TOTAL PRODUCTION - is the quantity actually harvested plus quantities which would have been acceptable for fresh market or processing but were not harvested because of economic or natural reasons.

UTILIZED PRODUCTION - is the amount sold plus the quantities used at home or held in storage.

UNUTILIZED PRODUCTION - is the difference between total and utilized production which is fruit not harvested for economic or natural reasons and harvested fruit not sold or utilized.

UTILIZATION - refers to first utilization, not necessarily final utilization. For example, frozen fruit includes some fruit that may be later used for making preserves. Grade-outs for fresh market fruit which are processed are included in the processing quantity. Fruit graded-out from canning or freezing and utilized for juice is included with juice.

APPLES, COMMERCIAL CROP - orchards of 100 or more bearing age trees.

PRICES - are a season average for all methods of sale. For a crop sold for both fresh market and processing, the season average price is a weighted average of the fresh and processing price.

Prices for fresh fruit are the average prices producers receive at the point of first sale. This is commonly referred to as the AVERAGE PRICE AS SOLD. Since the point of first sale is not the same for all producers, prices for the various methods of sale are weighted by the proportionate quantity sold. For example, if in a given State part of the fruit is sold f.o.b. packed by growers, part is sold as bulk fruit at the packinghouse door, and some is sold retail at roadside stands, the fresh fruit AVERAGE PRICE AS SOLD is a weighted average of the average price for each method of sale. The exception is fresh fruit sales in California, Washington and Oregon which are equivalent returns at packinghouse door. New York began using equivalent returns at packinghouse door in 1985. The equivalent packinghouse returns represent adjusted prices.

F.o.b. packed prices are adjusted to an equivalent incoming packinghouse door price by subtracting all costs that accumulate between the incoming packinghouse door and the f.o.b. price. These costs include grading, packing, inspecting fees, selling, and other costs.

Prices for fruit sold for processing are equivalent returns for fruit delivered to the processing plant door except for cranberries and California olives and clingstone peaches which are priced at the first delivery point.

Crop value estimates in this report cover the marketing season or crop year and should not be confused with cash receipts from these crops which are on a calendar year. The following procedure is used to compute State values for all commodity groups:

STATE VALUE COMPUTATION PROCEDURE

Fresh Market Value = Fresh Market SAP x Fresh Market Utilization
Process Market Value = Process Market SAP x Process Market Utilization
"All" Sales Value = Fresh Market Value + Process Market Value
"All" Sales SAP = "All" Sales Value Divided By
"All" Sales Utilization

For commodities with components not identified by market channel, substitute breakdown name for fresh/processing market and use the same procedure. The procedure used for computation of U.S. season average prices follows:

U.S. SAP COMPUTATION PROCEDURE

Fresh Market SAP = Fresh Market Value For All States Divided By
Fresh Market Utilization For All States
Process Market SAP = Process Market Value For All States Divided By
Process Market Utilization For All States
"All" Sales SAP = Sales Value For All States Divided By
Sales Utilization For All States
